

MAXIM

Low Power, 3½ Digit A/D Converter With Display Hold

MAX136

General Description

The Maxim MAX136 is a monolithic analog to digital converter with very high input impedance. It differs from the Maxim ICL7136 in that the MAX136 provides a Hold pin, which makes it possible to hold or "freeze" a reading. The MAX136 directly drives a non-multiplexed liquid crystal (LCD) display, requiring no external drive circuitry. With minor external component changes, it is pin compatible with the ICL7116 but with significantly reduced power consumption, making the MAX136 a superior device for portable systems.

Versatility and accuracy are inherent features of this converter. The dual-slope conversion technique automatically rejects interference signals common in industrial environments. True differential inputs allow direct measurements of bridge transducer outputs or load cells. The zero-integrator phase eliminates overrange hangover and hysteresis effects. The MAX136 offers high accuracy by lowering rollover error to less than one count and zero reading drift to less than $1\mu\text{V}/^\circ\text{C}$.

Applications

These devices can be used in a wide range of digital panel meter applications. Most applications, however, involve the measurement and display of analog data:

Pressure	Conductance
Voltage	Current
Resistance	Speed
Temperature	Material Thickness

Typical Operating Circuit

Features

- ◆ Power dissipation guaranteed less than 1mW-9V battery life 3000 hours typical
- ◆ Hold pin allows indefinite display hold
- ◆ Guaranteed first reading recovery from overrange
- ◆ On board Display Drive Capability—no external circuitry required
- ◆ High Impedance CMOS Differential inputs
- ◆ Low Noise ($< 15\mu\text{V p-p}$) without hysteresis or overrange hangover
- ◆ Clock and Reference On-Chip
- ◆ Zero Input Gives Zero Reading
- ◆ True Polarity Indication for Precision Null Applications
- ◆ Key Parameters Guaranteed over Temperature

ABSOLUTE MAXIMUM RATINGS

Supply Voltage (V^+ to V^-) 15V
 Analog Input Voltage (either input) (Note 1) V^+ to V^-
 Reference Input Voltage (either input) V^+ to V^-
 Clock Input, Hold Input TEST to V^+

Power Dissipation (Note 2)
 Cerdip Package 800mW
 Plastic Package 800mW
 Operating Temperature 0°C to +70°C
 Storage Temperature -65°C to +160°C
 Lead Temperature (Soldering, 60 sec.) +300°C

Note 1: Input voltages may exceed the supply voltages, provided the input current is limited to $\pm 1\text{mA}$.

Note 2: Dissipation rating assumes device is mounted with all leads soldered to printed circuit board.

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

Note 3: Test condition is V_{IN} applied between pins IN-HI and IN-LO, i.e., 1M Ω resistor in Figures 1 and 2.

Note 4: All pins are designed to withstand electrostatic discharge (ESD) levels in excess of 2000V. (Test circuit per Mil. Std. 883C, Method 3015. 2)

Note 5: Number of measurement cycles for display to give accurate reading.

Note 6: 1M Ω resistor is removed in Figures 1 and 2.

Note 7: Refer to "Differential Input" discussion (See Maxim's ICL7136 data sheet).

Note 8: Back plane drive is in phase with segment drive for 'off' segment, 180° out of phase for 'on' segment. Frequency is 20 times conversion rate. Average DC component is less than 50mV.

Low Power, 3½ Digit A/D Converter With Display Hold

MAX136

Detailed Description

The Maxim MAX136 3½ digit A/D converter is similar to the Maxim ICL7136 except for the addition of a Hold pin. For a detailed product description, and applications information (other than the operation of the Hold pin described below), refer to Maxim's ICL7136 data sheet.

Hold Input

The Hold input is a digital input with a logic threshold approximately midway between V^+ and Test. The MAX136 continuously performs conversions, independent of the Hold input. When the Hold input is at V^+ the display latch pulse is inhibited, and the display latches

are not updated; when the Hold input is low or at the Test voltage, the display is updated at the end of each conversion. The MAX136 maintains low power dissipation even during display hold by eliminating the pull-down resistor between Hold and Test present on the ICL7116. The Hold input is CMOS compatible, and can also be driven by a switch connected between Test and V^+ (Figure 1).

Reference Input

Unlike the ICL7136, the MAX136 does not have a Reference Low input. Apply the reference voltage between Reference High (REF HI) and Common.
