100126 9-Bit Backplane Driver

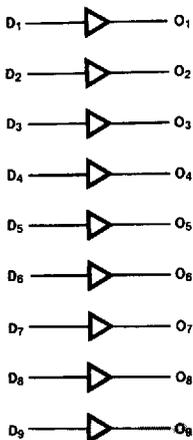

General Description

The 100126 contains nine independent, high-speed, buffer gates each with a single input and a single output. The gates are non-inverting. These buffers are useful in bus-oriented systems where minimal output loading or bus isolation is desired. The output transition times are longer to minimize noise when used as a backplane driver. All inputs have 50 kΩ pull-down resistors.

tion is desired. The output transition times are longer to minimize noise when used as a backplane driver. All inputs have 50 kΩ pull-down resistors.

Note 1: Absolute maximum ratings are those values beyond which the device may be damaged or have its useful life impaired. Functional operation under these conditions is not implied.

Note 2: Parametric values specified at -4.2V to -4.8V.

Note 3: The specified limits represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.

Note 4: Conditions for testing shown in the tables are chosen to guarantee operation under "worst case" conditions.
