## Octal Transparent Latch with TRI-STATE® Outputs

### General Description

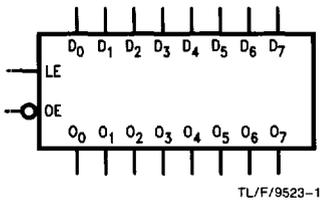

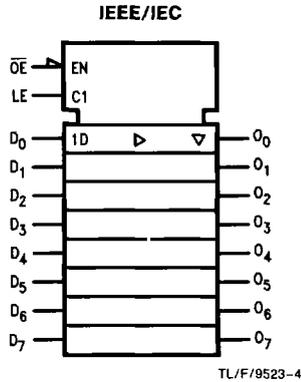

The 'F373 consists of eight latches with TRI-STATE outputs for bus organized system applications. The flip-flops appear transparent to the data when Latch Enable (LE) is HIGH. When LE is LOW, the data that meets the setup times is latched. Data appears on the bus when the Output Enable ( $\overline{OE}$ ) is LOW. When  $\overline{OE}$  is HIGH the bus output is in the high impedance state.

### Features

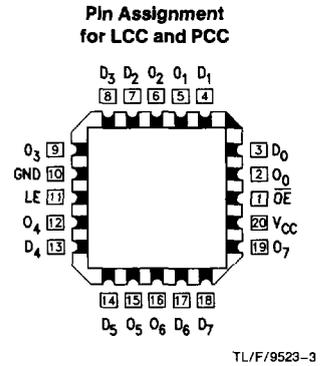

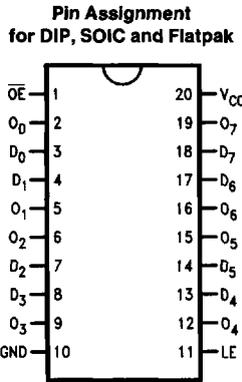

- Eight latches in a single package
- TRI-STATE outputs for bus interfacing

## Functional Description

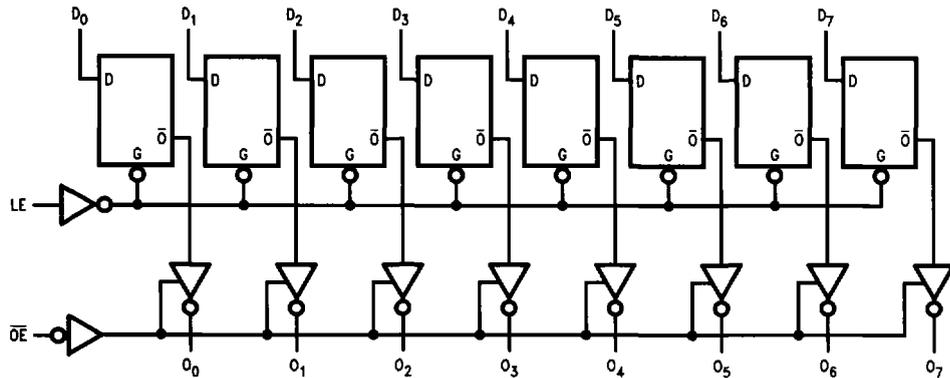

The 'F373 contains eight D-type latches with TRI-STATE output buffers. When the Latch Enable (LE) input is HIGH, data on the  $D_n$  inputs enters the latches. In this condition the latches are transparent, i.e., a latch output will change state each time its D input changes. When LE is LOW, the latches store the information that was present on the D inputs a setup time preceding the HIGH-to-LOW transition of LE. The TRI-STATE buffers are controlled by the Output Enable ( $\overline{OE}$ ) input. When  $\overline{OE}$  is LOW, the buffers are in the high impedance mode but this does not interfere with entering new data into the latches.

## Truth Table

Inputs			Output
LE	$\overline{OE}$	$D_n$	$O_n$
H	L	H	H
H	L	L	L
L	L	X	$O_n$ (no change)
X	H	X	Z

H = HIGH Voltage Level  
 L = LOW Voltage Level  
 X = Immaterial  
 Z = High Impedance State
